

If flooding occurs in the home, the unit may be affected if it was completely submerged under water. Typically, if the electrical in the home was affected where the unit is located, the unit may have damage as well.

After the system has had time to dry up, proper testing would need to be done to determine if damage has occurred. Plugging in the system after being submerged in water may cause further damage to it.

Systems involved with a flood are voided of all warranties from the date of the incident and any repairs are subject to full costs for the parts and labour.
